# Portfolio Design

1. Introduction

The Portfolio Design is a web application that works as a creative way to demonstrate and show the projects that you worked on. This application provides a platform to showcase your academic and professional experience with a creative twist. This application is more focused to exhibit the summary of different projects involved in by a backed developer.

2. Expected List of Features

- **Home**: This is the landing page which will contain a cover photo, profile picture and the title of the person.
- **About**: This section contains detailed description about the individual and a link to a traditional resume. This section will also contain links to social media for easy access.
- **Portfolio**: This section will showcase snapshots of different projects which will link to a descriptive version of the project.
- **Education and Work Experience**: The work experiences and academic certifications will be listed in this section.
- **Blog**: If the individuals have a blog or a separate site, this section will hold the snapshot and link to those sites.
- **Contact**: This section will contain the media through which the individual can be contacted.

3. Market Survey

Following websites and templates were reviewed for design and concept inspirations. Most of the designs were minimal and focused more on providing a placeholder for the snapshots of previous projects for easy viewing. Following are some of the websites that stood out for me:

- Freelancer Design: This template shows a simple portfolio design that focuses more on graphical designs. The division of the page to simple and minimum sections was notable.
- Grid Based Resume Design: The use of grid formatted design to divide the page into sections makes the website more organized even with a lot of information.
- Photographs Based Design: The use of creative photographs in different context as background images and cover pictures provides a different way of showcasing your products.
